

MSME and Artificial Intelligence (AI) in India: A Detailed Analysis

Anmol Kumar Sharma, Assistant Professor, EAFM, Govt N.M. College, Hanumangarh, Email - aksanm90@gmail.com

Abstract

In a developing country like India, Micro, Small and Medium Enterprises (MSME) are the backbone of the economy, contributing significantly to the GDP and also providing employment and business opportunities to millions of people. Modern technology, especially Artificial Intelligence (AI), is revolutionizing the MSME sector. Automation, data analysis, customer service, consumer demand, marketing and financial management can be improved through AI, which also increases the productivity and competitiveness of MSME. However, many times MSMEs also face many challenges in adopting AI, such as lack of financial resources, lack of technical knowledge, lack of trained people and limitations of digital infrastructure. To overcome all these obstacles, the government will have to provide policy support, technical tools, training programs and financial assistance. Along with this, MSMEs will also have to partner with AI startups and technology companies. If the right strategies are adopted, the MSME sector can use AI to increase its efficiency, profitability, training and market access, thereby boosting the economy of developing countries like India. This article will elaborate on the importance of AI in the MSME sector, its impact, challenges and possible solutions.

Keywords: Automation, Data Analytics, Customer Service, Financial Management, Digital Infrastructure, Technical Training, Government Policies, Competitiveness, Startups and Partnerships, Industry, Cyber Security, Business Expansion

Introduction -

Artificial Intelligence is one of the most revolutionary discoveries and technologies of today's era, which has brought unprecedented and surprising changes in various fields. Economics, which is the basis of the progress of any country, is also not untouched by AI. Production, marketing, financial management, employment, business and government policies have been effectively affected by AI. New jobs have been created and traditional businesses have also suffered losses, but some businessmen have taken advantage of AI and brought it to the market in a new way and earned huge profits and fame. This is a technology that can easily know both the analysis of consumers and their demand. If there is complete knowledge of its technology and it is used with a trick, then it can benefit both the businessman and the economy. AI is a technology and a person uses technology according to his knowledge, experience and intelligence. The use of this technology affects not only humans but also society and the economy. If it is used positively, then the economy benefits a lot. If it is used negatively, then it harms the individual, society and economy in both direct and indirect forms.

Micro, Small and Medium Enterprises (MSME) etc. play a very important role in the economy of India, a developing country striving to join the list of developed countries. This sector not only contributes to increasing the GDP of the country, but also provides new employment, business and employment opportunities. At the same time, Artificial Intelligence (AI) as a modern technology has also opened the doors of new possibilities for MSME by changing the way business operations are conducted.

Importance of MSME sector in India –

The MSME sector in India is called the backbone of the country. If we look at the data of 2022, then this sector contributes about 30% to the GDP of the country and also provides employment to more than 11 crore people. It not only plays an important role in job creation but also promotes industrial development, innovation and exports of the country.

The MSME sector is the second largest employment provider in India after agriculture. It

provides employment opportunities especially in rural and semi-urban areas. About 45% of India's total exports come from the MSME sector, making it competitive in the global market. The sector is not limited to metros but is spread across small towns and villages, reducing economic inequality and leading to overall development of the country. MSME also promotes startups and new business ideas, increasing the chances of developing new products and services.

Many MSME enterprises are run by women, giving them an opportunity to become self-reliant and thereby promoting socio-economic development.

The government is providing financial assistance through various schemes like Pradhan Mantri Mudra Yojana, Stand-up India, Start-up India, CGTMSE Yojana to strengthen the MSME sector.

The MSME sector is mainly divided into three parts:

1. **Micro Enterprises:** These are small businesses with minimal capital investment and limited workers. In India, as per the definition of micro enterprises, businesses with a total investment of less than Rs 1 crore and annual turnover of less than Rs 5 crore fall under the category of micro enterprises. These enterprises are mainly active in cottage industries, handicrafts, small manufacturing, service sector and household industries. Micro enterprises empower the economy by providing self-employment opportunities in rural and urban areas and play a supporting role to large industries.

2. **Small Enterprises:** These are enterprises which are larger than micro enterprises but smaller than medium enterprises. In India, small enterprises are those with a total investment of up to Rs 10 crore and an annual turnover of up to Rs 50 crore. They are mainly engaged in manufacturing, service and trading activities. Small enterprises play an important role in increasing employment opportunities at the local and national level, stimulating industrial development and contributing to exports. The sector is also considered important for empowering new entrepreneurs and promoting innovation.

3. **Medium Enterprises:** These are enterprises that are larger than small enterprises but smaller than large enterprises. In India, as per the definition of medium enterprises, businesses with a total investment of up to Rs 50 crore and an annual turnover of up to Rs 250 crore fall into this category. These enterprises are mainly engaged in the field of manufacturing, service and trading and are an important part of the supply chain of large industries. Medium enterprises not only increase competitiveness in local and international markets but also contribute to innovation and technological advancement, thereby boosting the country's economic progress.

The sector is spread across various industries including agriculture, manufacturing, service, and retail trade. The government is also implementing various schemes and policies to promote the growth of MSMEs.

Artificial Intelligence (AI) –

Artificial Intelligence (AI) is an advanced technology that gives computers and machines the ability to think and make decisions like humans. AI uses techniques such as machine learning (ML), deep learning, computer vision, and natural language processing (NLP). AI can be used to improve data analysis, automation, customer service, marketing, financial management, and production processes. For MSMEs, this technology can provide greater productivity and competitiveness at a lower cost.

Impact of AI in MSME sector –

The use of AI in the MSME sector can provide several significant benefits. This technology not only makes operations easier but also reduces costs.

1. Increased automation and productivity –
AI based automation tools help small and medium businesses reduce production costs and save time. For example, AI powered machines can assist in automated manufacturing, inventory management, and quality control.
2. Data analysis and decision making assistance –
AI based analytics tools can make business decisions more effective by analyzing data. It helps businesses understand market trends, customer preferences, and financial risks.
3. Improved customer service –
AI based chatbots and virtual assistants can improve the customer service of businesses by answering customer queries quickly. This increases customer satisfaction and brand credibility.
4. Marketing and sales enhancement –
AI can be used to understand customer behaviour, create personalised ads, and conduct target-based marketing campaigns. This helps MSMEs to acquire more customers.
5. Risk management and fraud prevention –
AI can be used in financial transactions to detect fraud and strengthen cybersecurity. This can be helpful in protecting small businesses from financial risks.

Challenges of AI adoption in MSME –

Although AI has many benefits, there are also many obstacles in adopting it in the MSME sector.

- Due to lack of technical knowledge, most MSME owners and employees do not have proper knowledge about AI and its use, which makes its effective use difficult.
- It also has some financial limitations. Sufficient capital is required to adopt AI. But small businesses do not have enough budget to implement it.
- Infrastructure and data security are also a challenge. Implementing AI-based technology requires strong digital infrastructure and cyber security, which is challenging for many MSMEs.
- Organizational resistance is also a problem. Many small businesses prefer to work in traditional ways and shy away from adopting new technologies.

Measures to adopt AI in MSME –

MSME in India should adopt the following measures to get the benefits of AI:

1. Government support and policies –
The government should provide financial assistance, subsidies and training programs to MSME to adopt AI.
2. Technical training and awareness –
AI related training programs should be organized on a large scale, so that small traders and employees can understand it. And they can do the work properly.
3. Collaboration and partnership –
MSME should partner with AI companies and startups, so that they can easily adopt new technologies. And can use it according to their requirement.
4. Developing affordable AI solutions –
Inexpensive and easily implemented AI solutions can benefit small businesses more. Indian startups and IT companies can work in this direction.
5. Improve digital infrastructure –
The availability of internet and cloud-based services can help MSME adopt AI.

Conclusion –

The combination of MSME and AI can make India's economy more empowered. Although there are challenges in adopting AI for MSME, with the right strategies and government

support, the sector can reach new heights. Using AI can make MSMEs more competitive and strengthen their presence in the global market.

By adopting AI based technologies, the MSME sector can increase its efficiency, profitability and market access, which will also boost the Indian economy. The MSME sector is a major driver of India's economic growth, innovation and social inclusion. It requires policy-making, technical support and financial assistance for its sustainable development.
